

ABSTRACT OF THE DISCLOSURE

A magazine includes a feeding tray adapted to be secured to a powered nail-driving tool and to accommodate stacked layers of nails, a gate member slidably disposed on the feeding tray to urge the lowermost layer of nails toward the tool, a nail-supplying member disposed over the feeding tray and having a stacking opening which is communicated with the feeding tray and which receives the layers of nails, and a separating member interposed between the nail-supplying member and the gate member. The separating member is coupled to the gate member so as to be movable therewith away from the stacking opening in a retracting course of the gate member for loading of the nails into the feeding tray, and to be moved underneath the stacking opening in an advancing course of the gate member.
